Proposal / Introduction

Mark Pennington has been engaged by Waikato Regional Council to review the modelling completed by Woods (working on behalf of Ambury Properties Ltd) for the proposed development at 88 Lumsden Road/231 Tahuna Road, Ohinewai. Findings will be discussed and shared with WRC. This meeting was the first model review discussion meeting to agree on items listed below.

Minutes

Actio	on Items	Responsibility	Status	Agreement between Reviewer and Modeller
a)	Findings to the review will be discussed and shared with WRC	MP	Ongoing	Agreed
b)	Stormwater drains being surveyed, to be included in the model (to be represented in 2D)	AD	Ongoing	
c)	Check the DHI model vertical datum - possibly Moturiki 1953	AD / MP	Ongoing	
d)	Survey datum to be checked and confirmed to match DHI model	AD	Ongoing	
Pre	e-Development Model Development discussions			
e)	2D model boundary extent as shown in Appendix A		Completed	Agreed
f)	2D model extent to be subtracted from the contributing NAM runoff catchment (catchment 25)	AD	Ongoing	Agreed
g)	Infiltration losses to be modelled for 2D domain once predevelopment model is validated against the Waikato River model	AD	Ongoing	Agreed
h)	Stormwater drain survey data to be included in the model when available		Waiting for drain survey to be completed	Agreed
i)	River Waikato (along with the associated lateral link) trimmed as per the 2D model extent		Completed	Agreed
j)	River Waikato stop banks within 2D extents to be modelled as per DHI model		Completed	Agreed
k)	Rangiri Spillway to be modelled as per DHI model in 1D		Completed	Agreed
l)	1D model extent to include modelled streams to include all control gates - Lake Waikare Control gate, Whangamarino Control gate, Te Onetea Control gate		Completed	Agreed
m)	All the control gates to be included in the model based on the DHI model (Lake Waikare Control gate, Whangamarino Control gate, Te Onetea Control gate)		Completed	Agreed
n)	Lake Waikere to be modelled in 1D based on Waikato River DHI model as additional storage in cross section data		Completed	Agreed
o)	Level storage relationship to be checked against DEM elevations to avoid double counting of storage. Area represented in 2D domain to be subtracted from Lake Waikere storage.	AD	Ongoing	Agreed
p)	DHI model to be checked for Lake Waikere storage being modelled appropriately	AD	Ongoing	Agreed
q)	Lake Ohinewai included in 2D model using depth contours provided by WRC		Completed	Agreed
r)	Hydraulic grade between Lake Rotokawau and Lake Waikere to be checked against connecting stormwater drain survey data is available		To be checked when drain survey data is available	Agreed
Ро	st Development Model Development Scenarios:			
s)	To be discussed on completion of Pre-Development scenario	AD / MP	Planned	Agreed
Sto	op bank breach scenarios:			
t)	To be discussed on completion of Pre-Development scenario. Initial thoughts:	AD / MP	Planned	Agreed
u)	Calculate water level differences between River Waikato and eastern land adjoining the stop bank along the stopbank length to assess the critical location for stopbank breach.	AD / MP	Planned	Agreed

Woods Sakti Gounder – Stormwater Engineer

W-REF: P18-258 16 September 2019

Memorandum

88 Lumsden Road/231 Tahuna Road – Stormwater Summary

This memo has been written to summarise the stormwater modelling proposed to be undertaken for the site at 88 Lumsden Road and 231 Tahuna Road, Ohinewai. Both addresses are part of the development site held by the New Zealand Comfort Group (NZCG), a subsidiary of Ambury Properties Ltd (APL).

APL are intending to develop both sites to include industry, factory outlet shops, a service centre and community focused shops/activities and a medium density residential development.

This memo summarises the stormwater flood modelling strategy for the proposed development. The flood modelling strategy has been formulated to quantify the effects of development on the water levels in Lake Waikare, Lake Rotokawau and neighbouring sites.

1. Modelling approach

The site lies to the east of the Waikato Expressway and the Waikato River. The site location is indicated in green in Figure 1. The site is located to the east of the stop banks along the Waikato River.

Three modelling scenarios are proposed to be run:

- Pre-development model: to quantify the existing scenario.
- Post development model: to quantify the effects of development. Effects includes any increases in water level or flood extents within Lake Waikare, Lake Rotokawau or neighbouring sites.
- Post development optioneering models: to quantify the effects of development across Lake Waikare/Lake Rotokawau and other neighbouring sites with proposed stormwater management devices in place.
 - It should be noted that the post development optioneering models will quantify flood effects with stormwater attenuation devices in place.
- An emergency management scenario: to quantify effects in the instance of a damn/stop bank breach. Flood results to quantify inundation risk to the development.

Waikato Regional Council (WRC) have requested that all future/post development models use the RCP6.0 temperature increase to model future rainfall scenarios with an additional sensitivity analysis to be done for RCP8.5 temperature increase.

RCP6.0 and RCP8.5 are models to represent increase in rainfall resulting from climate change. RCP stands for representative concentration pathways for the greenhouse gas emissions currently in the atmosphere. RCP6.0 represents a 'stabilisation pathway' scenario, where the effect of greenhouse gas emissions stabilises after 2100. This is a conservative estimate of increases in rainfall due to climate change.

RCP8.0 represents a 'business as usual' concentration pathway, with very high greenhouse gas concentrations by 2100 and beyond. This represents extreme increases in temperature and will result in a conservative estimate of flood levels for the project. It should be noted that the RCP8.0 scenario will only be run as part of a sensitivity analysis.

WRC are kept involved and informed throughout the project as Woods are working collaboratively with Mark Pennington who has been appointed as the reviewer by WRC.

Figure 1: Site location

2. Modelled extent

Woods have received Waikato Regional Council's (WRC's) Mike by DHI model of the Waikato River. The modelling scope includes running a 'cut down' version of the model to set a baseline scenario to be used to quantify the effects of the development on Lake Waikare, Lake Rotokawau and other land holders in the area.

The DHI model is a 1D model of the Waikato River only and does not include the rivers and lakes to the east of the expressway. Woods have defined a modelling approach, which has been shared with WRC. This section summarises the modelling approach.

Woods propose to take the existing 1D model and incorporate the 2D extents to quantify the effects of filling in the site. The proposed extents of the 1D/2D model can be seen in Figure 2.

Figure 2 shows the following features:

- The proposed model extent in white;
- Farm drains- to be modelled in 2D highlighted with red lines;
- Lake Ohinewai to be modelled in 2D as lake depths are available;
- Lake Rotokawau representation to be discussed with WRC;
- Lake Waikare to be modelled as a 1D storage node with spillway and flood gate as per WRC' Waikato River DHI model;
- Boundary conditions:
 - o Inflows into Lake Waikare within the proposed model extent
 - o Tailwater boundary conditions to be considered from Lake Waikare; and
 - o Tailwater boundary conditions in the Waikato at the outlet from the model extent

- Alternate boundary condition for Lake Waikare to be confirmed in discussion with WRC (described in section 3)
- Location of the proposed stop banks to the west of the Waikato Expressway as per WRC 's Waikato River DHI model (shown in green in Figure 3 below)
- The proposed model also includes the gates as shown in Figure 2 below and gate operations are modelled as per the Waikato River model.

Figure 2: Proposed model extents

Figure 3: Control Gate locations

3. Other Considerations

Based on records of the Waikato Regional Flood Event of 9 – 20 July 1998, the following information is known about historical flooding in Lake Waikare:

- The lake level in the 1998 event is approximately 6.29 m RL.
- The lake levels are artificially controlled between 5.50-5.65 m RL.
- The design flood level of the land drainage scheme is 7.37 m RL.

• The spillway for Lake Waikare is at 8.00 mRL. This means that water levels in Lake Waikare will reach a maximum of 8.00 mRL.

There will be proposed topographical changes to the site following development, including the filling in of existing floodplain storage to raise the site out of the floodplain, as well as increases in runoff volume resulting from on-site intensification. All stormwater management devices on site will address both flood displacement volume and attenuation volume from the increase in impervious area.
